

## COMMERCIAL STEAM SHOWERS

Commercial steam showers create some of the most demanding environments for superior waterproofing measures due to their extreme conditions: They generally cover more area, receive higher volumes of water, and are in virtually continuous use, compared to residential steam showers which are typically only used intermittently. These conditions mean commercial steam showers have less time to dry out between uses so the moisture management system must perform exceptionally well.

When not designed properly, commercial steam showers can allow for mold growth in wall cavities, for wood framing to rot, and for damage to occur in moisture-sensitive wall coverings on the opposite side of stud cavities. The KERDI-DS waterproofing membrane is specifically designed to manage both water and vapor in extreme conditions, making it the ideal solution for commercial steam showers. Check out the application below to learn more about KERDI-DS, and the other related KERDI components.
